

ASSET VISION® WORKSTATIONS: Unified Cloud Service Overview

# Secure dramatic cost savings in software license and maintenance

## Service Description

Asset Vision Workstations is a subscription-based IT asset usage and management service. Delivered via a secure cloud architecture, it offers agentless and agent-based asset inventory, tracking, normalization and usage metering. In addition to license management features, the service combines an extensive CMDB capability with integration and import tools which allow it to function either standalone or integrated with a wide variety of IT management functions.

## Key Functionality

**Device Discovery.** Asset Vision uses a range of device discovery methods to provide comprehensive coverage of all supported device types and classes regardless of network topology or asset ownership. A full picture of all Wintel and non-Wintel hardware is discovered for both physical and virtual assets.

**Service Discovery.** Asset Vision detects the presence of common services device-by-device. Oracle instances, SQL and Terminal Service instances along with VMware features are just some examples of the services that Asset Vision can detect.

**Discovery Reconciliation.** A discovery layer integrated into Asset Vision's tracking capabilities enables direct, automated reconciliation of discovered asset information with contractual and other manually maintained information. Asset Vision can import discovery data from external sources such as Microsoft's SCCM for further reconciliation of device information. The net effect is a very high degree of confidence that reported IT asset status matches reality with a 360 degree view of an asset portfolio.

**Usage Metering.** Minute by minute comprehensive information for usage of SaaS and desktop software is collected and displayed in easy to understand dashboards. This accurate identification of unused and underutilized assets is a solid basis for reduction of IT spending by eliminating unnecessary maintenance costs, reallocating existing assets and cutting of support demand.

**Embedded Normalization.** All discovered details make use of Asset Vision's cloud-based, crowdsourced catalogue to ensure normalization of names. In addition, information in the catalogue is used to enrich the discovered assets with vendor-sourced information, such as warranty status, patch vulnerability, location, and license metrics.

**Software License Management.** Accurate inventory is only one part of the software compliance equation; license entitlement must be known and defended. Asset Vision has powerful and flexible license management features that enable the consistent import of license entitlement data.

## About Scalable

Scalable Software's SaaS-based Asset Vision provides customers with tools to reduce costs of unused software and other IT assets. From discovery and normalization, for license management and governance, to integration with other enterprise IT and ERP systems, Asset Vision provides a foundational ITAM solution.
